

Looking for Healthy Infant Controls to Help Evaluate a Patch for the Diagnosis of Milk Allergy (APTITUDE Study)

Principal Investigator: Dr. Stephanie Leonard
Director, Food Allergy Center at Rady Children's Hospital San Diego

What

A study evaluating an investigational product in the form of a patch for the diagnosis of non-IgE mediated milk allergy in infants with upset stomach such as recurrent vomiting, diarrhea, persistent distress/colic, regurgitation, or blood stool after consuming cow's milk containing products.

Who

We are looking for healthy infant controls age 1-24 months who tolerate cow's milk containing products (including regular formula) **without** the above symptoms.

Pay

Compensation up to \$261.

If interested in learning more about the APTITUDE study, please contact our research coordinator:
